  - b. Purpose
  - c. Benefit
- II. PROJECT DESIGN
  - a. UML Use Case Diagram
  - b. UML Class Diagram (Be sure to apply OOP features like inheritance, polymorphism, abstract class and/or interface)
  - c. Design Pattern/s Used (Minimum of 2)
- III. SAMPLE SCREEN SHOTS
- IV. PROJECT PROGRAM LISTING – source code

## **I. PROJECT CONTEXT**

### Description

The software for the Real Estate Sales and Management System is capable of managing at least 5 blocks to 20 lots per block of subdivision. The system is able to specify the desired lot description: eg, size in square meters, location of block, and price total. It is also capable of displaying a list of lot properties based on a user's chosen specification. The finalization stage where the user is purchasing or reserving a property, the system will generate a report based on the fill form the user completes.

The UI is simple and intuitive with a plain green background that contrast well with the content and appealing font type all around. To complete the system our group will apply the following concepts onto our system:

- Encapsulation
- Aggregation
- Inheritance
- Interface

### Purpose

The purpose of making the software is to make a user-friendly application for real estate managers which provides the user with a catalogue of properties according to their demands and range with just one click. The system will ensure time saving, saving resources, easy approach to your requirements, as well as bring on more security. There is a login system, and everybody who uses the platform will gain because business transactions will no longer need to be manually assessed. The administrator will update the status of real estate availability. As a result, the system will boost the company's efficiency and dependability. It simplifies the process for potential employees by giving them a simple user interface via which they can purchase and enquire about the unit of their choice, potentially leading to a larger customer base due to ease of access.

## Benefit

Real Estate Sales and Management must have a system in place to track the status and efficiently sell real estate based on its size in square meters, location, and price. With the system at hand, the administrator can easily select supplied options and examine all the current data, saving time in dealing with problems and arduous technicalities and having excellent productivity methods. The process is efficient, accessible, and easy, which benefits both the firm administrator and the consumer. OOP concepts and design patterns that logically implement functions were used to support the software. whereas everybody who uses the platform will gain because business transactions will no longer need to be manually assessed. The administrator will update the status of real estate availability. As a result, the system will boost the company's efficiency and dependability. It simplifies the process for potential employees by giving them a simple user interface via which they can purchase and enquire about the unit of their choice, potentially leading to a larger customer base due to ease of access.

## **II. PROJECT DESIGN**

### **A) UML Use Case Diagram**

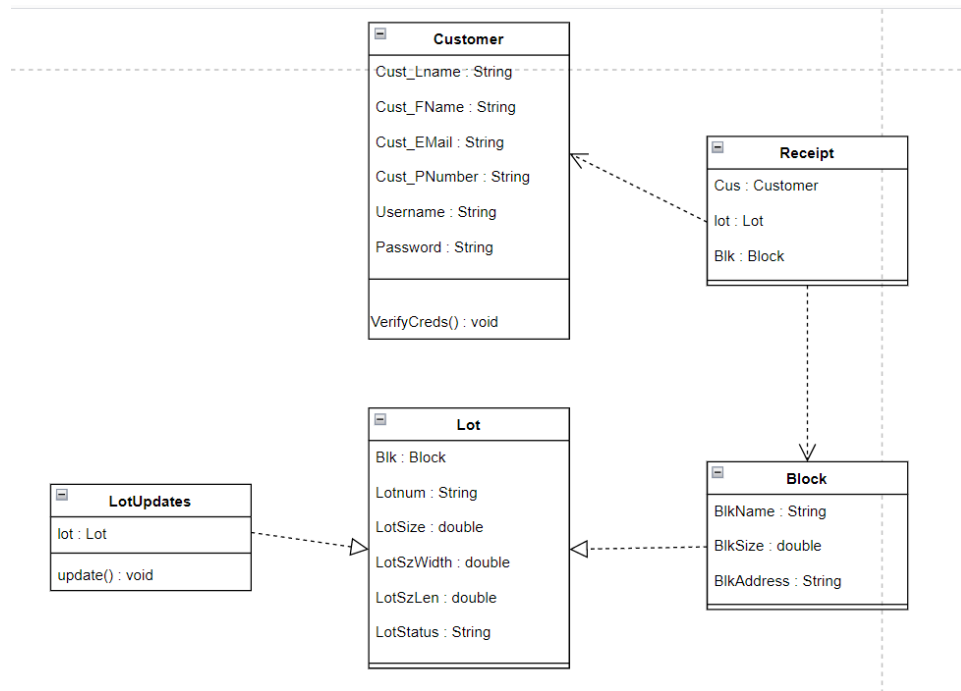

Figure 2.1: UML Use Case Diagram

## B) UML Class Diagram

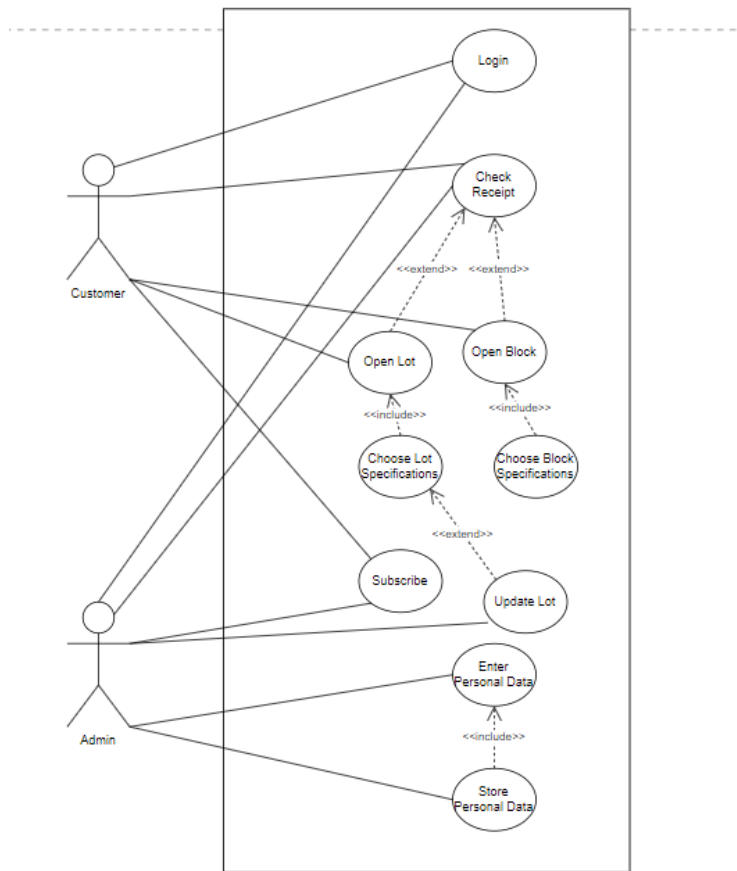

Figure 2.2: UML Class Diagram

## C) Design Patterns

### Prototype Pattern

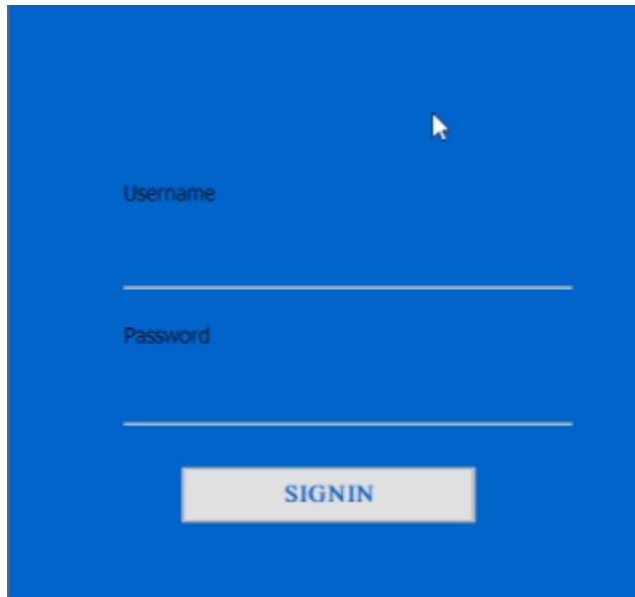

This pattern is used in the program using the Sales class and the JFrame for sale wherein the window for the Sales class can be opened while having another window open in the background. In this case, the user can open a client window or property window simultaneously with the sale window and the database would still be updated.

### Singleton Pattern

The loginform.java file is an example of a singleton pattern in this program. The file only has one instance in the entire system and cannot be found anywhere else in the system. The login form allows users to log in to the system and access the rest of the program which makes it an essential part of the program.

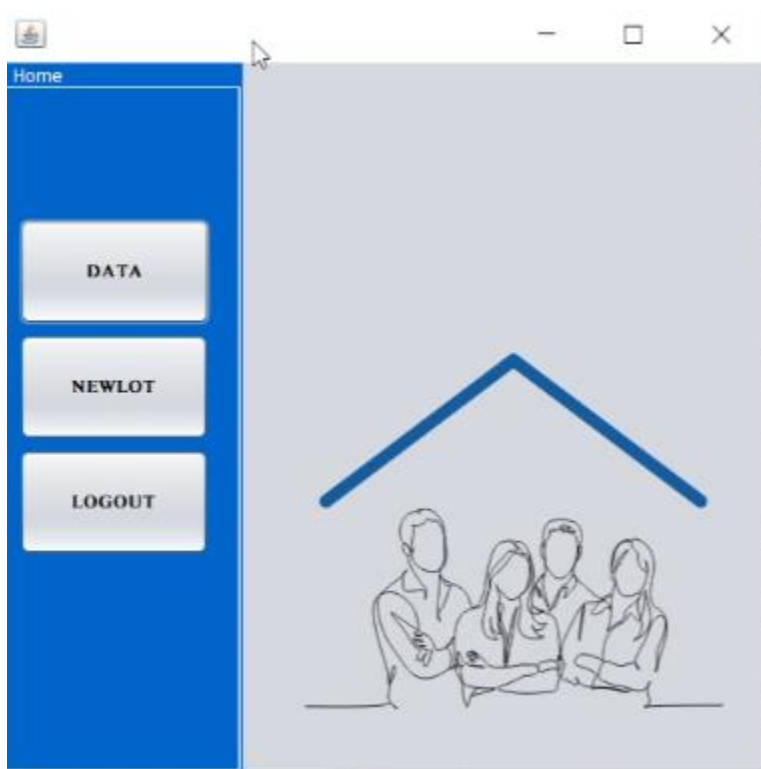

### III. SAMPLE SCREENSHOTS

LoginForm

A screenshot of a login form with a solid blue background. The form contains two input fields: the top one is labeled "Username" and the bottom one is labeled "Password". Below these fields is a light gray rectangular button with the text "SIGNIN" in blue capital letters. A white mouse cursor is positioned over the "Username" input field.
